

Aprilaire®

COMMERCIAL HUMIDIFIERS

**HIGH CAPACITY, VERSATILE,
EASY-TO-INSTALL UNITS THAT
MAKE COMMERCIAL HUMIDIFICATION
AS EASILY ACCOMPLISHED AS
RESIDENTIAL INSTALLATIONS**

Aprilaire Commercial Humidifiers, available in three models, bring new versatility and simplicity in providing controlled humidification in commercial installations. They provide humidification by the evaporative process—eliminating mists, droplets, "white dust," and have these important features:

HIGH CAPACITY — Evaporate as much as 4½ gallons of water per hour.

VERSATILE — Models for use with any type heating.

CONTROL — By an accurate humidistat.

EASE OF INSTALLATION — Installation steps are comparable to those for residential units.

MINIMUM MAINTENANCE — Water flushes minerals to drain.

MODEL 1120

MODEL 1130

MODEL 1140

Aprilaire®

COMMERCIAL HUMIDIFIER

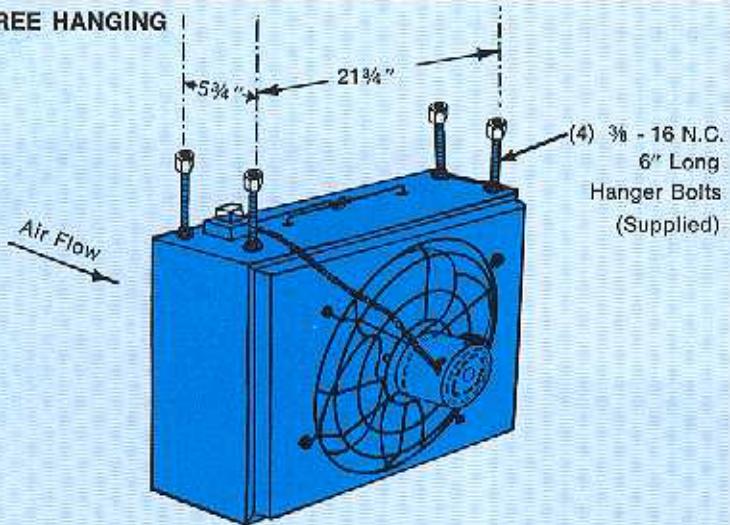

MODEL 1120

A self-contained model, designed for installation in the conditioned space, and independent of the heating system. Hot water from the service water heater is supplied to the unit, and furnishes the heat necessary for evaporation. Air movement is accomplished by a two speed fan, which pulls dry air into the humidifier, through the Water Panel® evaporator, and distributes humidified air into the conditioned space.

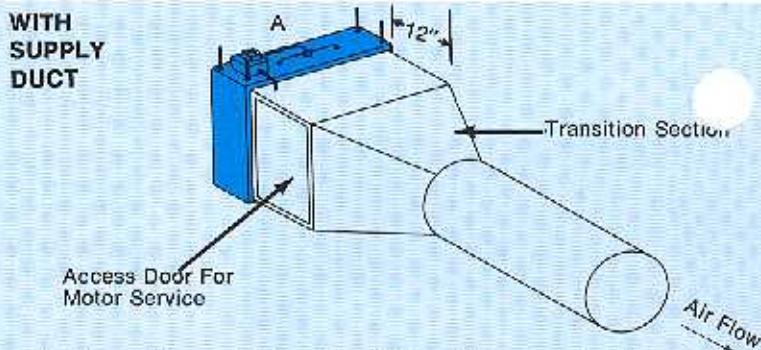

HOW TO SPECIFY

The humidifier to be of the wetted element evaporative type. The evaporative media to be fireproof and rustproof with a mineral coating not susceptible to fungus or bacterial decomposition. The evaporative media to be slit and expanded aluminum having an adherent water wicking mineral fiber coating. The evaporative media to be self-supporting. The humidifier to be self-contained for installation in the conditioned space. To be furnished complete with a 24-volt humidistat, 120 volt 60 Hz motor and water solenoid valve, a combination relay/transformer, saddle valve and mounting bolts. The humidifier to have an evaporative capacity of 2.64 gallons of water per hour when using 25 gallons per hour of 140° F. service hot water under ambient conditions of 35% relative humidity at 72° F.

FREE HANGING

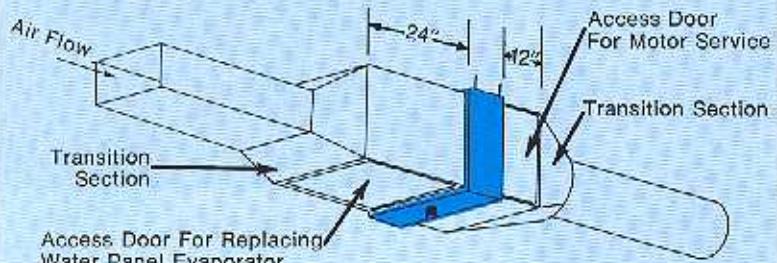

WITH SUPPLY DUCT

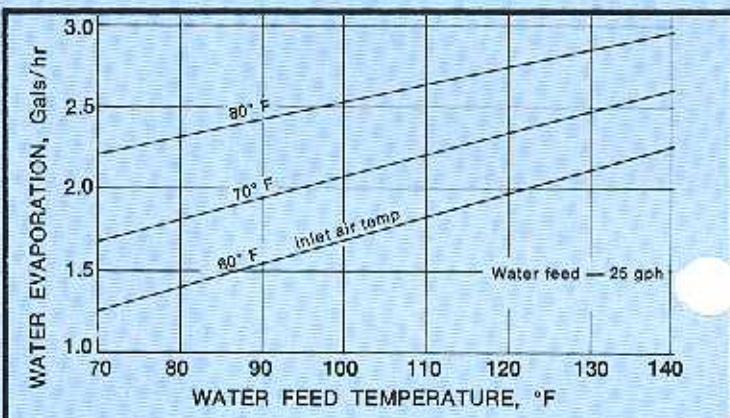

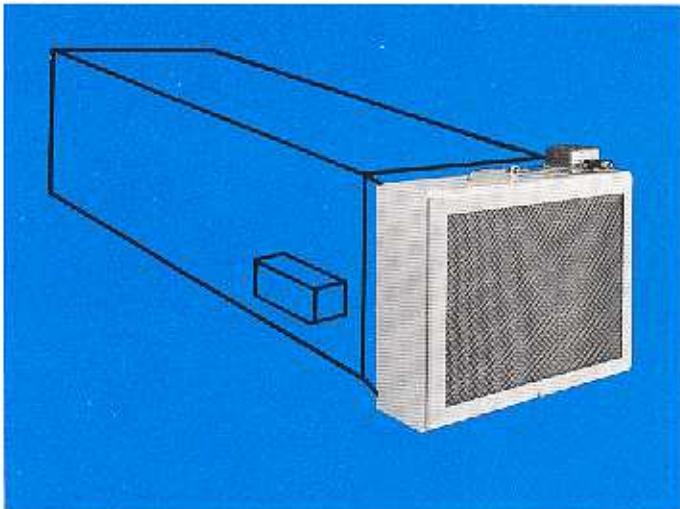

1. The resistance of the add on duct, grilles, etc. should not exceed .25 inches w.g.
2. The transition section must follow good sheet metal practice.
3. The minimum duct size is 16" round or 12" x 20" rectangular (inside dimension).
4. Fiber glass duct may be used for sound attenuation.
5. Water Panel evaporator replacement requires 18 inches open space at A.

WITH SUPPLY AND RETURN DUCT

1. The resistance of the add on duct, grilles, etc. should not exceed .25 inches w.g.
2. The transition sections must follow good sheet metal practice.
3. The minimum duct size is 16" round or 12" x 20" rectangular (inside dimension).
4. Fiber glass duct may be used for sound attenuation.

Aprilaire[®]

COMMERCIAL HUMIDIFIER

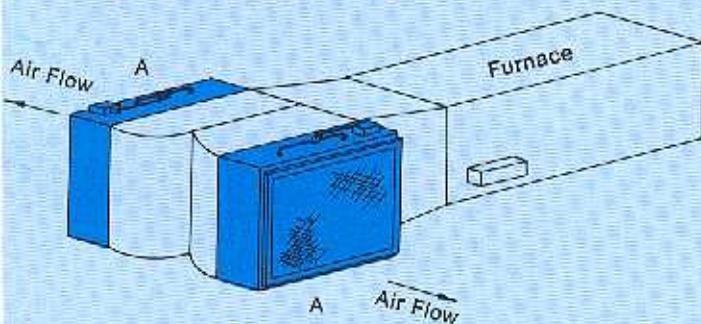

MODEL 1140

Model 1140 is designed for installation with its own forced air heat source and is installed independent of the building heating system. A transition fitting connects the unit to the heat source—and humidified air can be discharged into the immediate area or duct work can be installed for distribution to other locations.

HOW TO SPECIFY

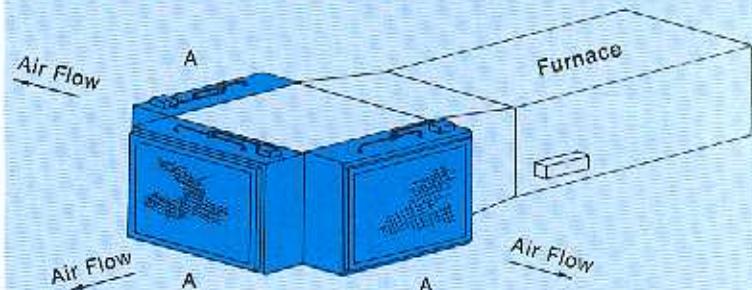

The humidifier to be of the wetted element evaporative type. The evaporative media to be fireproof and rustproof with a mineral coating not susceptible to fungus or bacterial decomposition. The evaporative media to be slit and expanded aluminum having an adherent water wicking mineral fiber coating. The evaporative media to be self-supporting. The humidifier to be designed for use in conjunction with a heat source to supply warm air necessary for evaporation. The humidifier to be supplied complete with 24 volt humidistat, 120 volt 60 Hz water solenoid valve and saddle valve. Under ambient conditions of 35% relative humidity and 72° F. the humidifier to have an evaporative capacity of 4.57 gallons of water per hour when used with a heat source having 800 cfm of 140° F. air. (See package specification table and performance curves for capacity at other application conditions.)

SINGLE HEAT SOURCE, 2 1140's

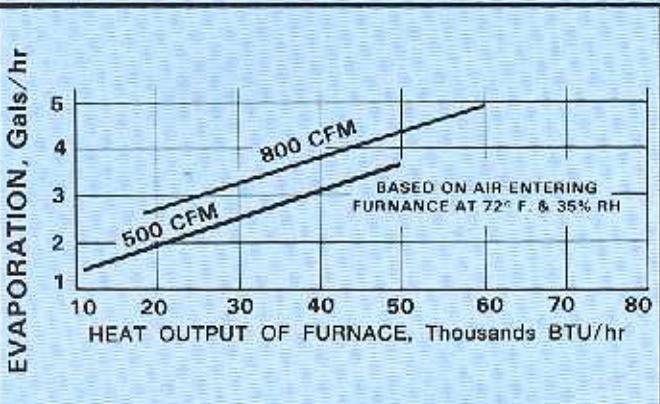

1. The resistance through the 1140 is 0.2 inches w.g.
2. Water supply— $\frac{1}{4}$ " copper tubing to each unit from a $\frac{3}{8}$ " (min.) source.
3. Water Panel evaporator replacement requires 18" open space at A.
4. All heat source air must be directed through the 1140's.

SINGLE HEAT SOURCE, 3 1140's

1. The resistance through the 1140 is 0.2 inches w.g.
2. Water supply— $\frac{1}{4}$ " copper tubing to each unit from a $\frac{3}{8}$ " (min.) source.
3. Water Panel evaporator replacement requires 18" open space at A.
4. All heat source air must be directed through the 1140's.

EVAPORATIVE CAPACITIES AT BTU OUTPUTS

PACKAGE SPECIFICATION TABLE (ONE FURNACE AND TWO OR MORE MODEL 1140 UNITS)

FURNACE OUTPUT BTU/Hr	NUMBER MODEL 1140 REQUIRED	FURNACE* AIRFLOW CFM	TOTAL EVAPORATION RATE GAL/HR	LEAVING TEMPERATURE °F. HUMIDIFIED AIR
60,000	2	1000	5.0	80
90,000	3	1500	7.5	80
120,000	4	2000	10.0	80
150,000	5	2500	12.5	80
300,000	10	5000	25.0	80
450,000	15	7500	37.5	80

*When ordering furnace, specify the blower and motor that would be used if cooling coils were added.

The need for COMMERCIAL HUMIDIFICATION

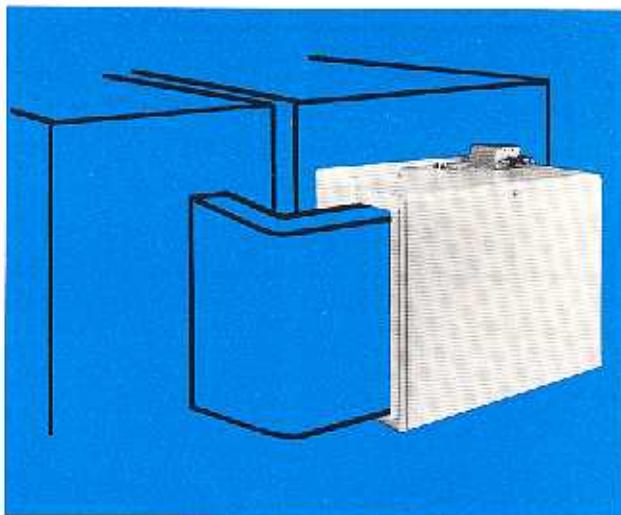

There are very few commercial establishments that do not require additional moisture during the heating season. Among the reasons for needing higher relative humidity are preservation of the product being produced, preservation of a building or its contents, or meeting a process requirement. Maintaining of comfort conditions, of course, is an added benefit. The product or process involved will determine the level of relative humidity that should be maintained. Anytime there is a need to control temperature $\pm 2^{\circ}\text{F}$, there probably is a need to control relative humidity.

In commercial humidification, the level of relative humidity should be maintained regardless of the type of building construction or the

effects that high humidity might have on structural members. In constructing a new building, of course, anticipated humidity requirements should be taken into consideration during the planning and design stages.

The following list includes some of the users who require controlled humidity and temperature. Recommended levels are indicated for both, along with the purposes of controlled humidity. The list is based on information obtained from the Heating, Ventilating and Air Conditioning Guide, U.S. Forest Products Laboratory pamphlets, customer contracts, and other reliable sources. For further information, see the ASHRAE Guide Applications, or other trade sources.

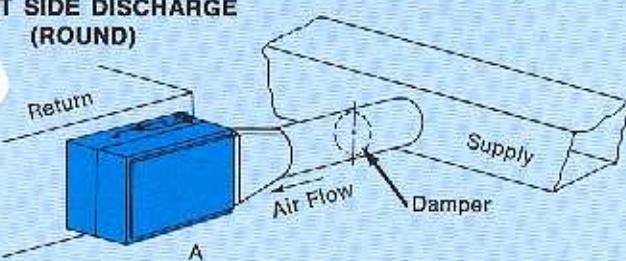

USE	Fahrenheit Temperature	Relative Humidity	PURPOSE
Bowling Centers	68°-75°	40-50%	Dust control, favorable approach conditions, & lively reaction of the pins & kickbacks.
Churches	70°	35%	Stop drying out of pews, organ pipes, etc.
Cotton Classing	65°-75°	60-65%	To obtain the maximum length & strength of the cotton fibers.
Electronic Accounting & Computing Equipment	72°-75°	40-60%	To prevent machine cards & tapes from expanding or curling—reduce static electricity.
Fur Storage	40°-50°	55-65%	R.H. must be above 55% to prevent hair splitting. Caution: Mold growth if above 80%.
Leather Processing & Products	70°-120° 50°-60°	40-75% 40-60%	Leather is sold by weight and water content must be maintained for weight. Leather is more pliable with proper humidity; prevent cracks.
Libraries & Museums	70°-80°	40%	To prevent drying out of papers, wood & other vegetable material.
Music Stores	70°	40%	Prevent drying of wood, reeds, etc.
Office Areas	70°-72°	35%	Comfort and health.
Photo Studio & Supply Storage	70°-80°	35-50%	See printing and paper storage.
Plywood (hot pressed)	90°	50%	Prevent uneven expansion and poor contact in gluing of plys.
Precision Machining	68°-80°	35-50%	Dust & Quality Control.
Printing & Paper Storage	68°-75°	35-50%	Prevent distortion of paper size, static electricity, poor inking and non-uniformity.
Wood Processing & Fabrication	70°	50%	To reduce expansion and contraction and allow even curing.

HOW TO SPECIFY

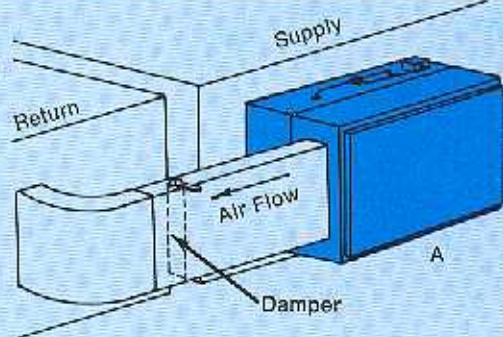

The humidifier to be of the wetted element evaporative type. The evaporative media to be fireproof and rustpoof with a mineral coating not susceptible to fungus or bacterial decomposition. The evaporative media to be slit and expanded aluminum having an adherent water wicking mineral fiber coating. The evaporative media to be self-supporting. The unit to be designed for installation on a forced air handling system. To be designed for mounting on either the supply or return plenum. To operate on the "by-pass" principle. The humidifier to be supplied complete with 24 volt humidistat, 24 volt 60 Hz solenoid valve and a 24 volt transformer, saddle valve and mounting accessories. Under ambient conditions of 35% relative humidity and 72° F., the humidifier to have an evaporative capacity of 2.64 gallons of water when supplied with 25 gallons per hour of 140° F. service hot water or a capacity of 4.57 gallons of water per hour when applied to an air handling system providing 800 cfm of 140° F. air. (See performance curves for capacity at other application conditions.)

RIGHT SIDE DISCHARGE (ROUND)

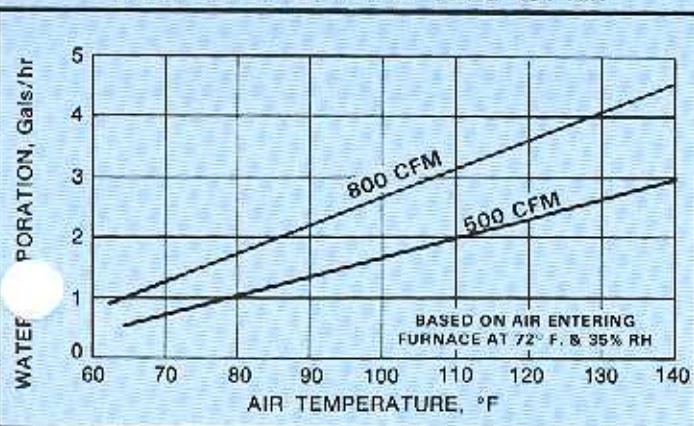

1. It is essential that the by-pass connection be dampered. The damper must be closed during the cooling season. If the total system pressure differential exceeds 0.2 inches w.g. the damper should be set so that a slant gauge or manometer reads 0.2 inches w.g. across the Water Panel evaporator.
2. Use 6" x 18" rectangular or 12" round duct for by-pass connection.
3. Water Panel evaporator replacement requires 18" open space at A.
4. By-pass section opening can be right or left.

LEFT SIDE DISCHARGE (RECTANGULAR)

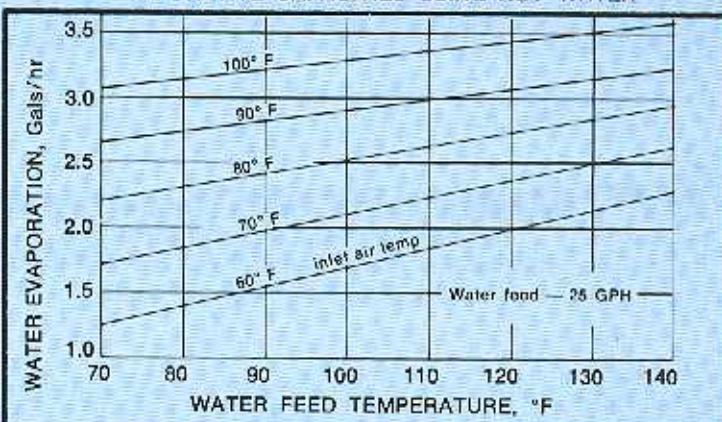

1. It is essential that the by-pass connection be dampered. The damper must be closed during the cooling season. If the total system pressure differential exceeds 0.2 inches w.g. the damper should be set so that a slant gauge or manometer reads 0.2 inches w.g. across the Water Panel evaporator.
2. Use 6" x 18" rectangular or 12" round duct for by-pass connection.
3. Water Panel evaporator replacement requires 18" open space at A.
4. By-pass section opening can be right or left.

EVAPORATIVE CAPACITIES USING HOT AIR

EVAPORATIVE CAPACITIES USING HOT WATER

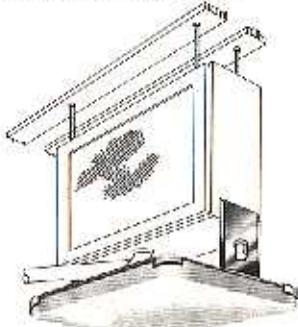

EASY REFERENCE SIZING CHART (cubic foot capacities)*

TO MAINTAIN R.H. of: (at 70°F)	30%	35%	40%	45%	50%	55%
One 1130 or 1140 @ 120°F Air - 500 CFM	55,300	47,300	41,350	36,700	33,000	29,950
One 1120 or 1130 @ 140°F Hot Water	63,900	54,600	48,000	42,400	38,100	34,600

EXAMPLE: 40% R.H. Desired, 70,000 cfm/hr (fresh air), use two 1120 if independent, two 1130 or 1140 if on 120°F air and 500 CFM.

*Determine cubic footage to be humidified from fresh air make-up, exhaust air, or infiltration, whichever is larger. Chart cannot be used if cooling unit operates simultaneously with humidifier. (See Form A-1774.)

DRAIN SAFETY™ WARNING DEVICE

Illustrated above is the 1101 Drain Safety™ warning device. It can be used with any 100 series humidifier and is usually required for any humidifier installation that is concealed over a finished area. It eliminates the need for costly auxiliary drain equipment.
